thermoCet International BV is not responsible for any  
(consequential) damage due to incorrect installation.

V260226

# 1 INSTALLATION INSTRUCTIONS

## NOTE

The installation should be performed only by an authorized gasfitter.

- 1 The appliance must be installed, connected and periodically inspected and serviced by a qualified fitter as a closed appliance in accordance with local standards and regulations.
- 2 The flue tube system and the outlets in the outer wall or roof face must also meet the requirements outlined in the applicable local standards and regulations.
- 3 The temperature of the walls near the side and back of the appliance may not exceed the ambient temperature by 60 K or more. For example, ambient temperature 20°C plus 60 K gives a maximum temperature of 80°C.
- 4 The appliance has been approved in combination with the concentric flue system THC/Holetherm in accordance with European CE standards for gas appliances, and may therefore only be applied with this system.
- 5 The appliance needs to be inspected by the fitter for local gas distribution (gas type and gas pressure) as indicated on the identification plate.
- 6 The instructions are only applicable if the relevant country code is stated on the appliance.
- 7 There will be air in the gas pipes when the appliance is first used. The gas supply pipes therefore need to be vented first.

- 8 Ignite the appliance according to the user manual and check the flame is burning evenly. After the appliance has been used for the first time, any deposits resulting from curing must be removed from the glass panel using a glass cleaner made specifically for fireplaces (see chapter 12 *Cleaning and maintenance*).

### Distance from flammable materials

Do not place flammable materials within 500mm of the part of the appliance that radiates heat.

### Distance to non-flammable materials

The appliance needs to be placed a minimum distance of 25mm from the sidewall.

## WARNING

- 1 Gas fires become hot when in use. After installation of the appliance, the glass panel surface is considered to be an active zone. The glass panel surface can become very hot.
- 2 Therefore, you should take care by, for example, keeping children and those requiring help away from the immediate vicinity of burning fires. Gas fires must not be placed on or against flammable materials.

# 2 PLACING THE APPLIANCE

## NOTE

- 1 Before installing the appliance, please read Chapter 3 *Removing a frame, glass panel and/or door*, 9 *Concentric pathways*, 10 *Concentric flue system* and APPENDIX 2.
- 2 Do not start the installation until you have read and understood the installation instructions.

## 2.1 Preparation and installation

- 1 Check the packaging for damage. Remove the packaging and check the contents are intact and complete. Report damage and defects to the supplier immediately.
- 2 The packaging contains the following components:
  - Unit
  - Remote control
  - Ceramic wood set
  - Restrictor(s)
  - 4 x AA battery
  - 2 x AAA battery
  - Suction cup(s)
  - Adjustable feet
  - Wide trims
  - Built-in cassette with identification plate
  - 45-degree bend Ø130-Ø200 Holetherm
  - 2 Convection grilles
  - Installation instruction
  - User manual

- 3 Place the appliance on a stable surface. Remove the glass panel (see chapter 3 *Removing and installing the glass panel*) so you can take out the packaged parts. Check it for damage and defects.
- 4 Put the appliance in place using the adjustable feet (supplied) and the wall mounting. The adjustable feet can be used for fine adjustment of the appliance; an optional leg extension set is also available. APPENDIX 4 Image 4
- 5 The gas controller must be installed in the gas control box (see Paragraph 2.2 *Connection to the gas supply pipe*).
- 6 The gas valve must be installed in the gas control box (see paragraph 2.2 *Connection to the gas supply pipes*). The distance between the gas valve and the appliance is determined by the cable length (maximum 1200mm, in combination with the LED module 1000mm).
- 7 The flue path determines whether a restrictor and/or baffle plate must be fitted (refer to chapter 9 *Concentric pathways and appendix 4 Preparation and installation*).
- 8 The baffle plate is secured with 2 screws. After loosening these screws, the baffle plate can be removed. The flue restrictor can be fitted by removing the bracket from the baffle plate and placing the flue restrictor between this bracket and the appliance. The baffle plate can then be refitted. APPENDIX 4 1 2 3
- 9 Connect the appliance to the concentric flue system.

- 10 Position the supplied convection grilles at least 500 mm below the ceiling. If the space between the grille and the top of the ceiling in the chimney is very high, it is recommended that a false ceiling made of refractory material be installed in the chimney. **APPENDIX 2**

## 2.2 Connection to the gas supply pipes

### APPENDIX 5

- 1 Remove the protective bracket under the appliance complete with gas valve (remove the tie straps) and secure it in the gas control box with the wing nut, which can be found inside.
- 2 Take account of the power supply: batteries or 230V adapter.
- 3 You can determine where the gas supply pipes will be placed, dependent on the layout. Ensure control equipment is not twisted during installation and there is no excessive tension. Accessibility of various connection points in relation to components needs to be maintained. After installation, check the connections are gas-tight. Use a 3/8" gas tap with a connector. Also ensure the gas supply pipe is free from dirt or sand. To prevent damage to the gas control equipment, the gas connection must be isolated from the electrical power.
- 4 Ignite the appliance for the first time without a glass panel. Check all the gas connections for leaks again. You can then switch the appliance off and put the ceramic wood set in place (see chapter 5 *Installation of the ceramic wood set and dispersion medium*).

### NOTE

- 1 If the appliance does not work properly and/or the flames do not look good, repeat the previous steps again while checking and correcting if necessary.
- 2 The glass will now need to be cleaned again (see chapter 12 *Cleaning and maintenance*).

## 2.3 Installation methods for in front of a wall

### APPENDIX 4

The tunnel and front can be placed free-standing and/or in front of a wall.

The finish can go up to the wide frame. The appliance must not be tightly enclosed by the building materials.

The gas controller must be easily accessible. This can be done using the door.

### NOTE

- 1 Use refractory materials for the casing.  
The appliance must be able to expand and contract during use.  
The refractory materials must not come into contact with the appliance.
- 2 Ensure the gas controller remains accessible.

### 3 DISASSEMBLING THE GLASS (LONG SIDE, PILOT FLAME SIDE)

- 1 Remove the thick trim. The low trim can be moved forward. The two uprights are attached with magnets. **1 4**
- 2 Release the transport lock on the left and right. **2 1**
- 3 Top glazing bar large glass panel: Loosen screw **7** slightly and tilt the tab. **5** This allows the handle to be lowered and the top glazing bar to be released. **6 7**. The handle can also be moved slightly to the outside to create extra space for removing the glass.
- 4 Glazing bar on the underside: Can be moved upwards with a screwdriver that fits underneath. **3 8**
- 5 Rear: This has a profile with springs that can be moved forward. **3 1**
- 6 Behind the profile there are two adjusting bolts that can be used to adjust the spring pressure on the glass.
- 7 Once everything is loosened, fit the supplied suction cup on the glass panel. The glass panel can then be moved slightly forward and to the left. It can then be pulled towards you and lifted up. Finally, the underside can be carefully turned towards you to remove the glass. **9 10**

4

5

6

7

8

9

10

### 3.1 Baffle plate

- 1 Use a spanner to remove the two screws from the baffle plate. **1**
- 2 Slide the baffle plate off the back wall. **2**
- 3 Install the restrictor in the designated position. **3**  
(See Chapter 9)
- 4 Re-install the baffle plate in the reverse order.

## 4 FITTING THE LED MODULE (OPTIONAL)

- 1 Disassemble the upright burner by unscrewing or completely removing the screws. **1**
- 2 Remove the deco mesh (two parts). **2**
- 3 Loosen the main burner by loosening the four nuts located close to the injector. **3 4**
- 4 Remove the 4 screws from the foot of the main burner. **5**
- 5 Remove the self-tapping screw from the upright burner on the right side. (This prevents the main burner from becoming stuck when removing it.)
- 6 Slide the burner to the left. **6 1** (This can be a bit tricky.)
- 7 Lift the burner slightly to make the sliding movement easier.
- 8 The bottom now reveals two rectangular plates attached with screws. **9**
- 9 Remove the screws and take out the plates.
- 10 Remove the LED units from the packaging and check the contents **7**. This consists of:
  - 2x LED-module
  - 2x set mounting brackets
  - 1x adapter
  - 2x glass plates
  - 1x splitter **8**
- 11 Place the LED unit into the openings where the rectangular plates were. **10**
- 12 The LED unit hangs in the brackets. **11**
- 13 Route the two cables at the bottom of the appliance towards the receiver.
- 14 Use the splitter **8** to join the two cables into one connection and connect it to the module port on the receiver. **12**
- 15 Test the LED module before installing the glass:
  - Connect the adapter to the receiver and install the batteries in the remote control. **13**
  - Press the light button on the remote control; the LED module should now illuminate. (If the remote control is not paired, the LED will not illuminate.) **14**
- 16 Attach the glass with the glossy side facing up (recognisable by the small sticker). **14**
- 17 Set the glazing strips in place and use the previously removed screws to install the whole thing. **15**
- 18 Taking care not to break the glass, carefully hand-tighten the screws.
- 19 Install the burners in the reverse order. **17**

- 7
  - A 2x LED-module
  - B 2x set mounting brackets
  - C 2x glass plates
  - D 1x adapter
- 8
  - 1x splitter

**NOTE**

If the appliance is installed lower than the minimum size from the drawing, there is a risk that the LED will overheat and become damaged.

**⚠ WARNING**  
 The LED module cable must not touch the ignition cable.  
 Beware of this during installation and after maintenance.

Ignition cable      LED module cable

LED module cable      Ignition cable

LED module cable      Ignition cable

Remove the sticker as soon as installation is complete. **16**

## 5 INSTALLATION OF THE CERAMIC WOOD SET AND DISPERSION MEDIUM

Pilot flame

- 1 Place the angular grit in the burner as shown in the image. 2

- 2 Distribute the glass granules around the burner. ③
- 3 Ensuring even, flat distribution, place the larger, round pieces on the burner.
- 4 Make sure that there is nothing directly in front of the flame opening near the pilot flame.

Pilot flame

Pilot flame

## 5.1 Disassemble the pilot flame, ignition cables and thermocouple

### Create the maximum amount of space:

- 1 Remove all logs from the fireplace.
- 2 Disassemble the upright burners.
- 3 Remove the deco mesh and dispersion medium.
- 4 There is now optimal access to the pilot flame and the thermocouple.
- 5 Remove the protective cap from the pilot flame.
- 6 Loosen the two screws on the pilot flame set.
- 7 The pilot flame can now be moved up a little to make the gas supply pipes accessible.

### Minimum space available:

This is only possible if the gas supply pipes under the appliance do not have a tight bend. There must be enough space to slide the gas supply pipes upwards.

- 1 Loosen the two screws on the pilot flame set.
- 2 Carefully slide the pilot flame set upwards.
- 3 Note: If this is not possible, follow the method with maximum space.

	Part	Article number
1	Pilotflame	642201030
2	Pilot flame injector G20/G25/G25,3	642201102
3	Pilot flame injector G30/G31	642201101
4	Pilot flame compressionring with union nut	642201103
5	Sealing pilotflame sit/mertik	721801131
6	Thermocouple 1500 mm	642200915
7	Ignitioncable	000000000

## 6 AR GLASS (OPTIONAL)

AR glass is a non-reflecting glass. This glass has an AR coating on both sides of the glass. The anti-reflection layer reduces the reflection to a minimal gloss.

### NOTE

- 1 The AR glass with coating is more sensitive to damage than normal glass.
- 2 Always wear soft cotton gloves when removing and installing AR glass.
- 3 The rubber suction cup(s) must be clean.
- 4 If the dismantled glass panel is damaged (scratches and/or damaged edges) do not use the glass pane; notify the supplier.
- 5 Use the thermoCet cleaner set to clean the AR glass. Other cleaning agents can damage the AR glass coating.
- 6 Do not use hard (abrasive) sponges, steel wool, abrasives and/or cleaning agents containing ammonia, (citric) acid or ceramic hob cleaner.
- 7 Do not leave any residue, such as fingerprints, behind. These will burn in and cannot be removed.

### IMPORTANT

After lighting for the first time, a haze may form on the inside of the glass panel. When the appliance has cooled down after the first use, the glass must be cleaned immediately. The glass must be cleaned again after the appliance has been in use for a month. After this, the amount of cleaning can be determined depending on the frequency of use of the appliance. Bear in mind that the glass can become dull if it is not cleaned in good time. Cleaning then becomes more difficult.

## 7 TECHNICAL DETAILS MAXITROL GV60

**⚠ WARNING**

Sealed parts must not be adjusted.

## 8 INSTRUCTIONS FOR MAXITROL GV60

### ⚠ WARNING

- 1 Ensure the fuel supplied to the appliance is clean and free from particles and moisture.
- 2 The appliance must not be turned on if the glass panel(s) is not present and/or is broken.

Before a gas supply pipe (new or existing) is connected to the main gas pipe at the gas meter and to the gas valve of the appliance, clean and dry compressed air needs to have been blown through it. Copper and aluminium pilot flame pipes that have been cut must be deburred and blown clean before they are connected.

### Heat, moisture and dust are a threat to all electronic components

Protect the electronic gas control until all construction, plastering and paintwork has been completed. If you cannot avoid this work, then protect the control against dirt and moisture penetration by covering it with plastic film for instance.

### ⚠ WARNING

- 3 Electronic components become permanently faulty when they are exposed to temperatures higher than 60°C. Normal AA batteries will crack open at temperatures >54°C and the battery contents will damage the electronic switches below. Batteries have the longest life span at <25°C.
- 4 Only install the gas valve and receiver as pre-installed at the factory.
- 5 Remember that components may have to be replaced or that repairs may have to be performed at a later date. This may prove to be more difficult if the control is installed in a different way to how we have described in instructions.

### Only insert the batteries after the receiver, gas valve and pilot flame have been wired.

Premature connection to the power source can damage the electronics. In the version with the LED module, inserting the batteries is not permitted. Use the mains adapter supplied with the LED module.

### 🔧 NOTE

- 1 Batteries must not be fitted in the receiver when using the power adapter.

### Ensure the ignition cable is not near the antenna wire and that they do not cross each other.

The high voltage released during ignition may damage the sensitive receiver circuit of the antenna. This could mean the appliance becomes less responsive or totally unresponsive to commands from the handset.

### 🔧 NOTE

- 2 Do not tighten the contact breaker and the thermocouple connection too tightly on the gas valve.
- 3 It is sufficient to tighten by hand and add a half a turn with an open-end spanner. Tightening too much will break the connection to the magnetic coil below and/or the insulation around the aluminium contact pin in the contact breaker. This may cause the magnetic coil to not open the gas supply to the pilot flame and prevent the appliance from functioning.

Extend the supplied thermocouple with just the original extension. (Available from your supplier) Unauthorized extension of the thermocouple has the effect of stress reduction, thereby the magnetic coil can not be activated.

Prevent leakage of ignition spark to parts of the installation other than the ignition rod on the pilot flame. Ensure the ignition cable is not in contact with the body or other metal parts. If a cable extension is used, ensure the connections have additional silicone insulation.

The receiver and the control units on the gas valve should be switched on to ensure automatic start-up via the remote control. The oval disc on the gas valve should be turned to the **ON** position. The **I/O** switch should be set to **I**. The ignition cable should be connected to the **SPARK** connection point on the receiver.

The system's thermostat sensor is located inside the remote control. The remote control operates best at a distance of 2 or 3 metres away from the appliance. Although communication occurs via shortwave radio signals, it is recommended that you place the remote control in the line of sight of the gas appliance, in a place where the user wishes to experience a pleasant temperature. Do not place the manual transmitter in direct sunlight or other warm locations. The thermostat measures the temperature and, accordingly, regulates the flame size of the gas appliance.

### 🔧 NOTE

- 4 Sealed parts must not be adjusted, to do so would void the warranty.
- 5 A waiting time of 5 minutes between each start attempt must be observed.
- 6 Remove batteries not with a metal tool. Removing batteries with a metal object can permanently damage the electronic control.

\*min 0,5 = Wall transit

Vertical lay out (NG-LPG)			
X-total min-max	Ø130-Ø200 reduction after 1 metre Ø100 - Ø150		
	Baffle plate	Restrictor NG	Restrictor LPG
2-4m	yes	25mm ring	20mm ring
4-8m	yes	35mm ring	30mm ring
8-12m	yes	40mm ring	35mm ring

Always adhere to a starting length of 1 metre

**Roof pass-through with 45° slope Ø130-Ø200 reduction after 1 metre Ø100-Ø150**

X-total min-max	Y-total min-max	Restrictor provision			
		Baffle plate	Restrictor NG	Restrictor LPG	
1m	0,5	ja	35mm ring	30mm ring	
1m	> 0,5 - 5,5	ja	25mm ring	30mm ring	

Always adhere to a starting length of 1 metre

**Example calculation image C**

**Step 1: calculate the chimney length**

**45-degree bend calculation length 1 metre**

X	7m	Y-totaal	0,7m	Calculated length of bend
bend 45	1m			
X1	1m	90° = 2m		
bend 45	1m	45° = 1m		
X2	1,5m	30° = 0,6m		
X-Total calculated	11,5m	15° = 0,3m		

**Step 2: calculate the Vertical X-Total ratio: Horizontal Y-total**

**Image D: Ratio Vertical : Horizontal (X+X1+X2) : Y ≥ 2 : 1**

**Y is for example 0.7 metres**

(X+X1+X2) : Y ≥ 2:1	9,5 : 0,7 ≥ 2 : 1	X:Y ratio = allowed
---------------------	-------------------	---------------------

**Step 3: determine restriction**

	Baffle plate	Restrictor NG	Restrictor LPG
X+X1+X2 - Y > 6 meter	yes	35mm ring	30mm ring
X+X1+X2 - Y ≤ 6 meter	yes	25mm ring	30mm ring

**Roof pass-through with 90° slope Ø130-Ø200 reduction after last bend Ø100-Ø150**

X-total min-max	Y-total min-max	Restrictor provision	Baffle plate	Restrictor NG	Restrictor LPG
		3-12 m	0-2 m	$X+X1 - Y > 6$ meter	yes
3-12 m	0-2 m	$X+X1 - Y \leq 6$ meter	yes	0	0

Always adhere to a starting length of 1 metre

**Example calculation image D**

**Step 1: calculate the chimney length**

Y is bijvoorbeeld 3m

X	3 m		calculated length of bend
Bend 90	2 m		90° = 2 m
Y	2 m		45° = 1 m
Bend 90	2 m		30° = 0,6 m
X1	1 m		15° = 0,3 m
X-Total calculated	10		

**Step 2: calculate the Vertical X-Total ratio: Horizontal Y-total**

Image D: Ratio Vertical : Horizontal (X+X1):Y ≥ 2:1

Y is for example 2 metres

(X+X1) : Y ≥ 2:1	4 : 2 ≥ 2 : 1	X:Y ratio = allowed
------------------	---------------	---------------------

**Step 3: bepaal restrictie**

	Baffle plate	Restrictor NG	Restrictor LPG
$X+X1 - Y > 6$ meter	yes	25 mm ring	20 mm ring
$X+X1 - Y \leq 6$ meter	yes	0	0

# 11 CONCENTRIC FLUE SYSTEM

The concentric flue system is composed of an inner flue and an outer flue. These flues have been set up concentrically so the combustion gases will be discharged via the internal flue while the fresh combustion air is supplied via the gap between the inner and outer flues.

## 11.1 Components of the concentric flue system

Different connections are possible using the concentric flue system. These are:

### Through the roof face and through the exterior wall

The pathway used for this system can be laid in different ways, but there are a few important conditions:

- 1 The total allowed vertical flue length must not exceed 12 metres (the sum of the flue length and calculation lengths for the bends). See chapter 9 *Concentric pathways*.
- 2 90° bends have a 2-metre horizontal calculation length.
- 3 45° bends have a 1-metre horizontal calculation length.
- 4 The outlet can be installed at any point on the roof face or exterior wall (supply and discharge in an identical pressure area), but must meet applicable regulations.
- 5 Flue pathways must not be insulated.

#### NOTE

- 1 Ensure the restrictor is mounted in the correct manner, as indicated in these instructions.
- 2 The correct restrictor will provide the appliance with the most optimal efficiency, flame image and combustion.
- 3 Mounting an incorrectly placed restrictor may cause malfunction of the appliance.

## 11.2 Construction of concentric flue system

### Indirect wall connection

- 1 The outlet may also be installed in an upwards exhaust in the wall, taking any hindrance to the surrounding area into consideration, in accordance with local standards and regulations.

#### NOTE

Ensure wind pressure on the outlet is not excessive, such as in locations with a balcony, flat roof, corners and very narrow alleys, etc., as this can negatively affect the performance of the appliance.

- 2 Make a recess in the façade of around 155mm or 205mm when using respectively Ø100-150 and Ø130-200 flues (keep an extra space of 50mm in a refractory façade around the outer tube) and fit the façade pass-through with the wall plate on the inside of the wall. The wall plate of the exterior façade pass-through must be sealed sufficiently against the wall on the outside to avoid moisture and/or flue gas leaks leaking into the living space.

- 3 The flue should be encased if necessary. Even if the flue is to be installed along non-refractory materials, sufficient fire-resistant measures must be taken.
- 4 Determine the position of the appliance and outlet and begin construction of the flue with the connection on the appliance, paying attention to the direction of installation and connecting the elements by means of clamp strips.
- 5 An adjustable pipe can be used between the bends or when connecting to the appliance. If necessary, use wall brackets to support the flue.

### Mounting using the roof pass-through option

- 6 The flue outlet can be located at any random place on the roof face (supply and exhaust in identical pressure areas) and must meet the applicable rules and regulations.
- 7 A roofing sheet for a flat roof or a roofing for sloping tiled roofs can be used for a watertight duct. Use various bends for the slope, if required. The recess in the roof decking should be 50mm larger all around to ensure sufficient fire resistance.
- 8 One needs to take into account the regulation regarding fire resistance between rooms. (For this, see the applicable local standards and regulations.) A casing of fireproof material (for example, 12mm Promatect fire-resistant plate) should be applied up to 25mm from the outer flue.
- 9 Determine the position of the appliance and the outlet and begin the construction of the flue with the connection on the appliance (always 1 metre vertical first) pay attention to the direction of installation. The inner flue must be installed for draining purposes. Connect the elements using the clamping straps. Ensure all connections are gastight.
- 10 An adjustable pipe can be used between the bends or when making the connection to the appliance and/or the roof pass-through. Use 2 wall brackets to support the flue on each floor.

## 11.3 Installation instructions regarding existing flues

### APPENDIX 3

#### Instructions

The flue gas exhaust system falls within category: C91 and must be built in accordance with national rules and regulations and the instructions of the manufacturer, as specified in the documentation and installation instructions. This means, among other things, that the chimney pass-through must not be smaller than 150mm round/square, but no larger than 200mm, and not ventilated by grilles, etc. In the case of larger chimney pass-throughs, a flexible hose of around 150 mm may possibly be used in combination with a flexible hose of around 100mm, as described below. For other situations, consult your supplier.

## 11.4 Parts

Check all parts for damage before commencing the installation. For the conversion of a brick flue to concentric flue, connected to CC flue system, you need the components described in [APPENDIX 3](#).

### NOTE

The renovation/sanitation set consists of parts:

- ③ Interior mounting plate
- ④ Sliding element
- ⑦ Chimney mounting plate

## 11.5 Installation

- 1 Guide the flexible hose ⑤ through the existing flue ⑥.
- 2 Attach the slider ④ to the bottom of the flexible hose and secure this in place using two Parker screws.
- 3 Keep the bottom of the slider at the same height as the bottom of the flue or ceiling.
- 4 Shorten the flexible hose to approximately 100mm above the chimney coping.
- 5 Attach the mounting plate to the flexible hose on the roof ⑦, clamp it with a hose bracket. Stainless steel Ø90 to 165, secure the whole with Parker screws.
- 6 Attach the mounting plate to the chimney coping watertight on the roof ⑦ using silicone sealant and stainless steel screws.
- 7 Install the roof pass-through ⑨ and secure it in place using the supplied clamping strip ⑧.
- 8 The slider ④ will protrude approximately 100mm underneath the flue or ceiling after installation.
- 9 Attach the inner mounting plate ③ gastight against the bottom of the structural flue or against the bottom of the concrete floor using silicone sealant and screws.
- 10 Position the appliance in accordance with the instructions of the appliance manufacturer
- 11 Install a minimum of 1 metre of concentric flue type THC CC ①.
- 12 Extend the concentric flue using sections up to a minimum of 100mm in the structural duct. Finally, turn the clamping strip by hand in the mounting plate inside ③.

## 12 PASS-THROUGH POSITIONS AND FUNCTION CORRECTLY

Dimensions	Outlet positions	Distance mm
A	Distance to ventilation openings	Local*
B	Distance to ventilation openings	Local*
C	Distance to ventilation openings	Local*
D	Lower gutter bottom pipes or exhaust lines	500
E	Under the eaves	500
F	Under a carport, roof or balcony, inside and outside corners	500
G	From ground level and rainwater drainage pipes	300
H	Inside and outside a corner	500
I	Above an external gas pressure regulator	1000
	Side of a gas pressure regulator	500
J	Conflict distance façade outlet	Local*
K	Roof drain centre to centre	1000
L	From the centre of both roof drains	450
M	Two wall drains above each other	1000
N	Two wall drains next to each other	1000

\* In accordance with local building codes

## 13 CLEANING AND MAINTENANCE

- 1 The appliance must be checked and serviced by a recognised installer at least once a year. The glass is also cleaned during this process.
- 2 It is advisable to clean the outside of the appliance regularly, both in and out of the heating season.
- 3 Do not use aggressive or corrosive cleaning agents or sharp objects.
- 4 The concentric flue system must be cleaned every 2 years.  
A check must be carried out on:
  - a seal of the flue and supply circuits
  - b seal of the upper and lower pressure release hatches of the appliance; check the gasket
  - c operation of the pressure release hatches; that they can open and close freely
  - d the operation of the gas valve and ignition of the burner

### Measuring points

The appliance is equipped with measuring points to analyse the combustion gases and fresh combustion air. This allows the appliance to be checked.

# 14 QUICK REFERENCE GUIDE FOR FAULTSSEARCH FOR ENCLOSED GAS FIRES USING MAXITROL GV60 GASCONTROL

Function	Possible cause	Solution
1. Acoustic signals	1 long beep → reset switch OFF (0)	Set switch to (I)
	1 long beep → connections not complete	Check connections in thermocouple circuit
	1 long beep → 8-core cable defective	Check connections in connector/replace 8-core cable
	1 long beep → micro switch defective	Replace gas valve
	1 long beep → Sync not OK	Carry out new sync procedure for remote control/receiver
	3 short beeps → power supply	Replace batteries or 6-VDC adapter
2. No reaction remote control/receiver	Power supply problem	Check batteries/6-VDC adapter
	No sync remote/receiver	Carry out sync procedure
	Distance between remote control/receiver	Change position of receiver
	Defective receiver	Replace receiver
	Faulty remote control	Replace remote control
3. No pilot light gas	GV60 DC magnet unit does not open (no clicking noise from gas valve)	<ul style="list-style-type: none"> <li>• Check wiring and breaker on thermocouple circuit</li> <li>• Check/replace 8-core cable between remote control and gas valve</li> <li>• 1 x sparks and stop: check ground cable under torx gas valve</li> <li>• Replace receiver</li> <li>• Replace gas valve</li> </ul>
4. Poor/no spark	Spark cable loose	Check spark cable connections
	Short circuit between cable and metal	Check whether cable is free of metal parts
	Poor spark candle	Check spark candle for fractures, replace if necessary
	Distance of sparking candle to pilot light head	Check distance is approximately 4mm
5. Pilot light difficult to ignite	Gas supply pressure too high, nervous flame	Adjust gas supply pressure or adjust the pilot light pressure using the gas valve
	Gas supply pressure too low, short flame	Adjust gas supply pressure, check gas pipes, or adjust pilot light pressure using the gas valve
	Air in (pilot light) pipe, flame on/off	Blow pipes through, make air-free
	Injector blocked	Clean or replace pilot light injector
	Blocked/curved pilot light pipe	Check and clean pipe
	Pilot light head damaged	Check and replace pilot light
6. Pilot light goes out after ignition	Small pilot light, no flame on thermocouple tip	Check gas supply pressure, possibly too low
		Check pilot light injector and gas pipe
	Nervous pilot light flame, no flame on thermocouple tip	Check gas supply pressure, too high, adjust
		Adjust pilot light pressure on gas control block
		Air in pipes, vent
	Lazy pilot light, no flame on thermocouple tip	Check premix opening on pilot light, must be open
	Poor connections in thermocouple circuit	Check cables/breaker in thermocouple circuit
		Check thermocouple connections in gas control block, do not over-tighten.
Measure thermocouple circuit voltage 4.5mV minimum		
Bad thermocouple	Check open circuit voltage of thermocouple (18-30mV), replace if necessary	
Poor DC magnet unit in GV60	Replace gas valve	
7. Pilot light goes out when the fireplace is closed	False air along pilot light holder/gasket	Check pilot light holder and gasket for leaks
	False air hatches	Check pressure hatches/gasket is completely closed
	Main flame causes pilot light to go out	Check restriction/baffle in accordance with regulations

Function	Possible cause	Solution
8. Pilot light/main flame off	Gas pre-pressure has dropped	Check correct dimensions of gas pipe or blockage, correct
	Main burner ignition, 3 beeps, low power supply voltage	Check batteries or 6-VDC adapter
	Too much/little transport in unit/outlet	Check restriction/baffle situation in accordance with instructions.
	Concentric outlet pathway incorrect	Check outlet pathway in accordance with instructions
	Recirculation, façade/roof mouth position incorrect	Check outlet in accordance with instructions
	Recirculation in closed outlet system	Check outlet connections
9. Main burner does not start up	Gas control valve knob to MAN	Check gas control valve knob to ON
10. Delayed ignition of main burner	Pilot light burner blocked	Check logs, pebbles, etc. are in the right position. pilot light should be free of obstructions.
	Small/lazy pilot light	Check and correct pressure and physical state of pilot light burner
	Close main burner flame openings	Check and clean with a vacuum cleaner or similar device.
	Logs, etc. in wrong position	Check and correct, see instructions
11. Low main flame	Gas supply pressure too low	Check gas supply pressure and corrections
	Burner pressure too low	Check burner pressure, check instructions for correct values
12. No or little difference between high/low settings for main flame	Low position setting incorrect	Check and adjust low position in accordance with instructions
13. DB burner does not work	Defective step valve	Check whether clicking sound is perceptible, press button on remote control several times, replace valve if necessary
14. Sooty flame	Insufficient transport in unit/closed drainage system	Check restriction/baffle, follow instructions for correct value
		Check outlet system pathway in accordance with instructions
		Check outlet in accordance with regulations/instructions
	Excessive feed/burner pressure	Check and correct gas supply/burner pressure in accordance with instructions
	Blocked burner flame openings	Check and clean with a vacuum cleaner, for example
	Incorrect premix for main burners	Check and correct, see instructions
	Decorative logs, etc. in incorrect position	Check and correct, see instructions
